The World Bank

October, 2014

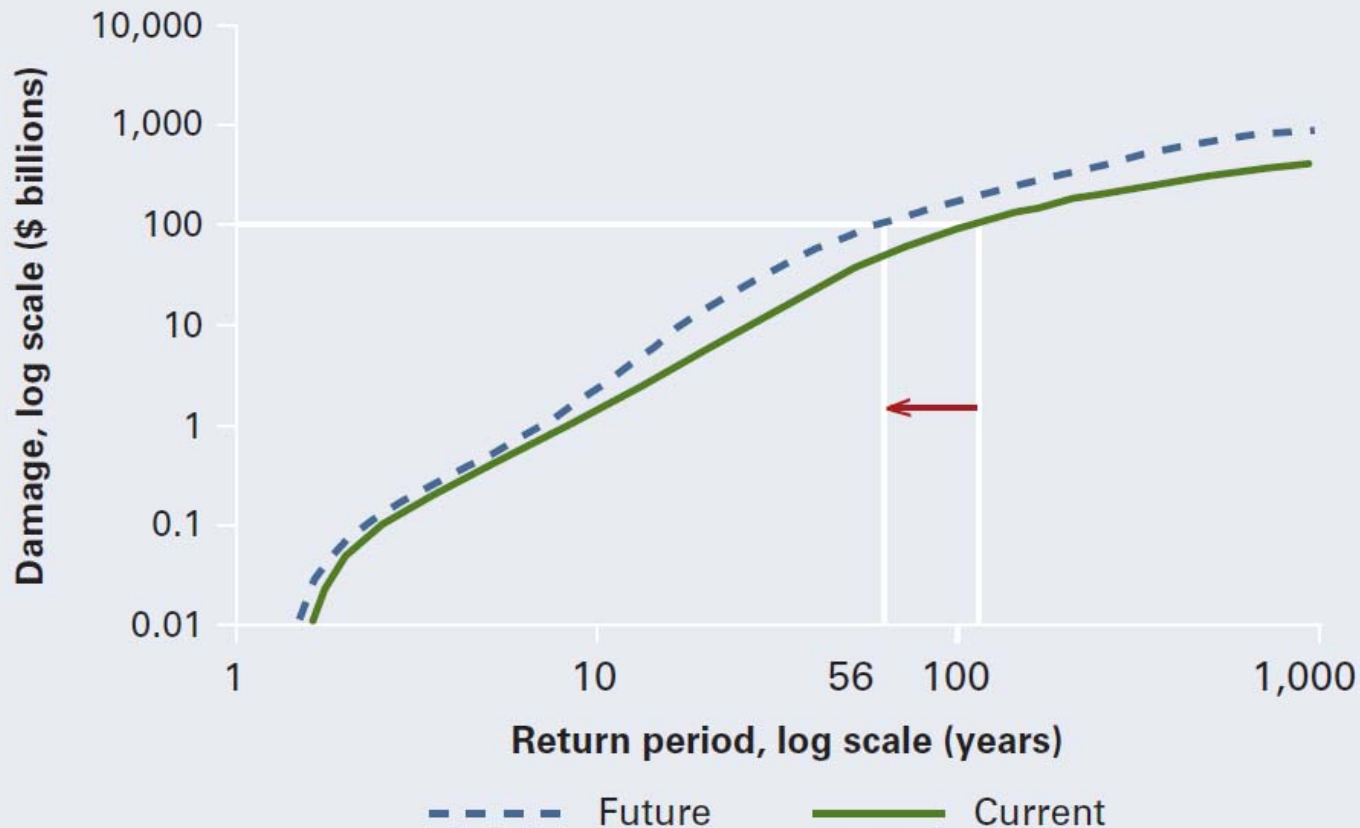

Exposure to cyclones and earthquakes in large cities may rise from 680 million people in 2000 to 1.5 billion people by 2050

Source: Brecht and others 2010.

Climate change shortens the return period of large storms

Note: The figure shows the return period for tropical cyclones of different intensity in the United States for one specific climate model (MIROC). A \$100 billion storm is estimated to happen once in a 100 years in the United States given the current climate. With a future warmed climate, it is expected to happen once in about 56 years.

TACKLING URBAN FLOODING RISK BY SHARING KNOWLEDGE

Urban flooding poses a serious development challenge, causing widespread devastation, economic damages, and loss of human lives. Together with partners, the World Bank assists cities in tackling urban flooding, through lending, technical assistance and global knowledge. Between 2012 and 2014, a series of knowledge-sharing workshops on Flood Risk Management and Urban Resilience were organized in Jakarta, Seoul, in Manila, with support from the Government of Republic of Korea through the Global Facility for Disaster Reduction and Recovery (GFDRR). The workshops brought together government officials, experts, academics, partners and stakeholders to share their technical and practical knowledge on integrated urban flood risk management and disaster resilience. The series of workshops helped to strengthen the capacity of national and local agencies involved in water resources and flood risk management, and urban planning, as well as to foster an international community of practice on urban flooding.
