

Transport, Energy and Environment: Where are We Going and How do We Change it?

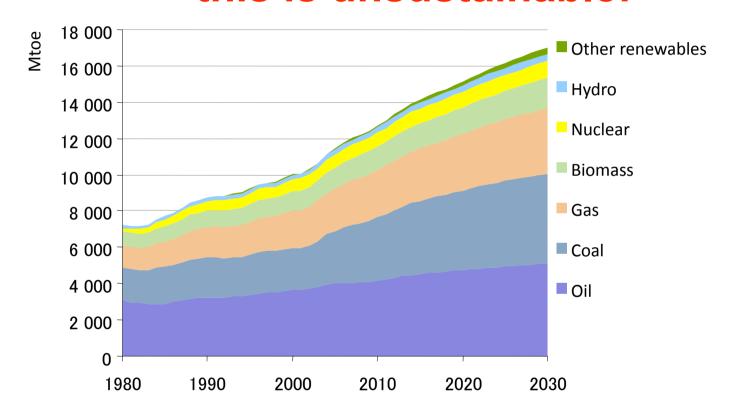

Nobuo Tanaka Executive Director International Energy Agency

The Ministerial Conference on Global Environment and Energy in Transport January 14-16, 2009

Tokyo, Japan

World primary energy demand in the Reference Scenario: this is unsustainable!

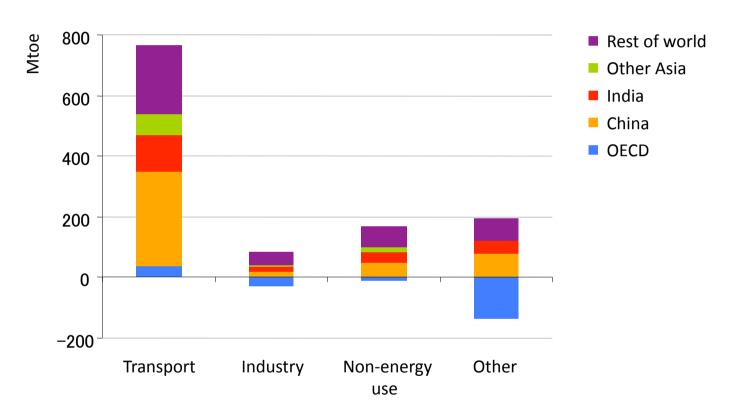

World energy demand expands by 45% between now and 2030 – an average rate of increase of 1.6% per year – with coal accounting for more than a third of the overall rise Slide 2

AGENCE INTERNATIONALE DE L'ENERGIE

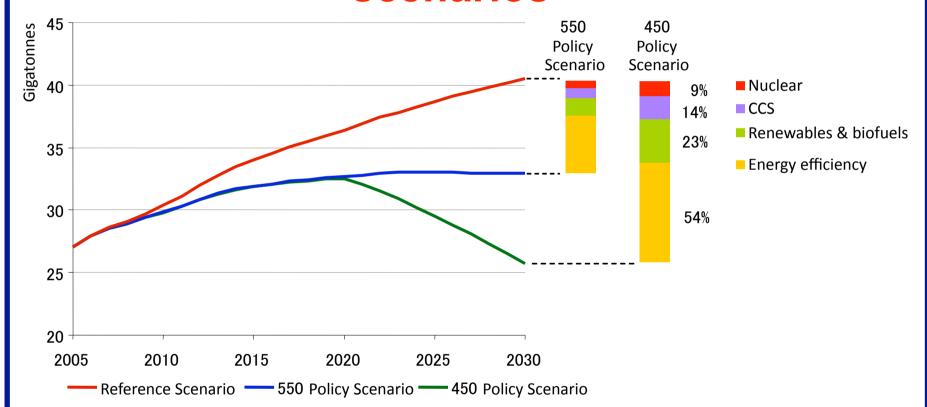

WEO 2008 Reference Scenario: Incremental oil demand, 2006-2030

Around three-quarters of the projected increase in oil demand comes from transportation

Reductions in energy-related CO₂ emissions in the climate-policy scenarios

While technological progress is needed to achieve some emissions reductions, efficiency gains and deployment of existing low-carbon energy accounts for most of the savings

IEA 25 energy efficiency policy recommendations across 7 priority areas

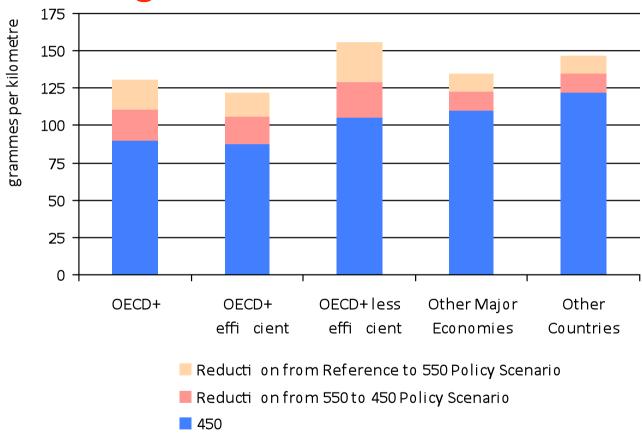

2000200220042006200820102012201420162018202020222024202620282030

Global implementation of recommendations could save around 8.2 GtCO₂/yr by 2030; this is equivalent to 20% of the WEO's global reference scenario energy related CO₂ emissions in 2030

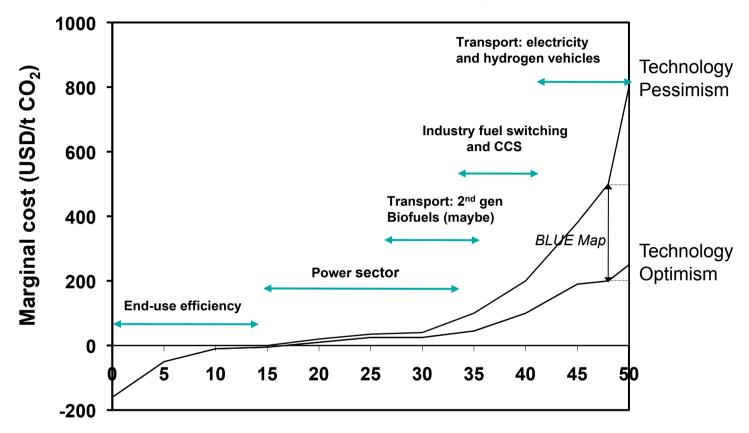

450 Policy Scenario: CO2 intensity improvement by region from sectoral agreements for LDVs in 2030

Adoption of stronger sectoral agreements in the transport sector in the 450 Policy Scenario sees a 25% improvement in average fuel economy by 2030

ETP BLUE Map - A New Energy Revolution ?

2050 CO₂ emissions reduction (Gt CO₂/yr)

To bring emissions back to current levels by 2050 options with a cost up to USD 50/t are needed. Reducing emissions by 50% would require options with a cost up to USD 200/t, possibly even up to USD 500/t CO₂

Low Cost Transport Option: Efficient LDVs

- New LDVs can become 50% more efficient by 2030
 - In some countries, progress toward this 50% target has already begun
 - This is, very roughly, moving from 8 L/100 km to 4. EU and Japan are already well below 8.
 - Some individual vehicles, like Prius are there already
 - Involves maximum use of available technology, including hybrids
 - Important to constrain increases in vehicle size, weight and power
 - Plug-in hybrids and electric vehicles may play a significant role if battery costs come down further

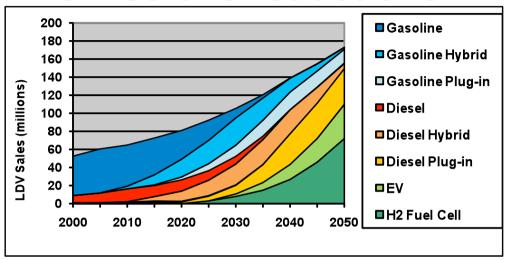

Global Fuel Economy Initiative IEA, ITF, UNEP, FIA Foundation

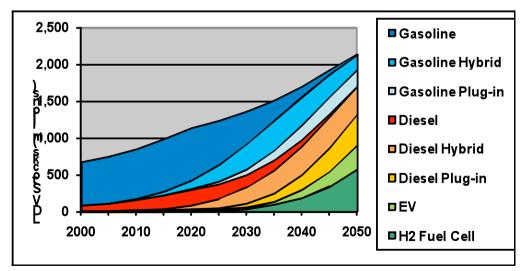

- IEA and its partners are soon launching a "Global Fuel Economy Initiative: Making cars 50% more fuel efficient by 2050 worldwide"
- This initiative will feature four key elements:
 - Data development and analysis of fuel economy potentials by country, region
 - Support for national and regional policy-making efforts
 - Outreach to stakeholders (e.g. vehicle manufacturers)
 - Information campaigns around the world to educate consumers, stakeholders

How transport can achieve deep CO2 emissions reductions?

Global Sales

Global Stocks

As in ETP BLUE MAP, new technology vehicles will need to achieve rapid market penetration

INTERNATIONAL ENERGY AGENCY

AGENCE INTERNATIONALE DE L'ENERGIE

Conclusions

- Without policy interventions oil use in many countries will increase significantly by 2050
- It appears reasonable to target a 50% reduction in vehicle energy intensity, on average around the world by 2050
 - However we need better data on baseline values and current trends in individual countries
- We need to identify information gaps, the optimal forms of policy, the role for different actors
- Economic stimulus packages that promote energy efficient and advanced technology provide an excellent opportunity to see greener, more sustainable growth in energy sector
