

VEHICLE SAFETY/POLLUTION RECALL CAMPAIGN IN JAPAN

Domestic Vehicles

CAMPAIGN No.	3790	DATE	April 14,2016
MANUFACTURER	MITSUBISHI MOTORS CORPORATION		
DESCRIPTION OF DEFECT	<p>① In the ECU control program for the engine for the vehicle with the turbo charger, the temperature of the exhaust gas may become significantly high when driven at the range of mid/high revolution and high loading condition due to inappropriate configuration of the fuel injection volume. As a result, if use continues at the condition, the exhaust gas may leak due to the crack of the exhaust manifold caused by the heat fatigue.</p> <p>② In the ECU control program for the engine for the vehicle with the turbo charger, the ignition timing may be delayed by the wrong detection of the knocking causing the temperature of the exhaust gas to become significantly high due to inappropriate configuration of the knocking control data. As a result, if use continues at the condition, the exhaust gas may leak due to the crack of the exhaust manifold caused by the heat fatigue.</p> <p>③ The radiator fan motor may stop its operation by the improper connection caused by the brush to absorb moisture and bloated due to inappropriate material of the brush. As a result, it may cause insufficient performance of air conditioner and/or the temperature increase in the coolant, and if use continues at the condition, it may cause the engine overheating or the engine stall.</p>
