

VEHICLE SAFETY/POLLUTION RECALL CAMPAIGN IN JAPAN

Domestic Vehicles

| | | | |
|-----------------------|---|------|------------------|
| CAMPAIGN No. | 4798 | DATE | September 3,2020 |
| MANUFACTURER | MITSUBISHI MOTORS CORPORATION | | |
| DESCRIPTION OF DEFECT | Strength of the radiator chamber for engine cooling system (a system which separates the bubbles in the cooling water) is insufficient. If the engine is stopped soon after the vehicle with loads is driven at high speed or at high rpm or on a slope upwards, and if this operation is performed repeatedly, sometimes the insufficiency can be the cause of a crack which leads to a leakage of cooling water. If the vehicle is continued to be driven, there is a risk of the engine overheating, and in the worst case, the engine stops and may not be able to restart. | | |
