Case 3: Lack of Knowledge, Skill, and Experience

Date and Time of Occurrence: Around 09:33, August 1, 2020

Type: New Wings MAX-R447/MAW (Weight transfer controlled ultralight plane)

Summary of the Accident: During a jump flight* at a temporary airfield with only one pilot on board for maneuver training, the aircraft unintentionally ascended and crashed from the nose shortly afterwards.

The airframe was severely damaged and the pilot was seriously injured.

*Jump flights are defined as flights made within the runway up to slight floating in the air (3 m altitude).

Flight conditions at the time of the accident Pilot training and operating conditions

Piloting instructor's guidance and judgment

The scheduled jump flight experience

with an instructor immediately prior to

Assumed jump flight training to the extent of ground gliding or slight floating

No jump flying experience by pilot only on board

Participated in instructor-on-board flying training in aerial maneuvering

the solo flight was not conducted. Instructed piloting procedures for solo flight

To avoid operational complexity,

- Push the control bar to the limit
- · Hold throttle opening at about half throttle
- · Tried to concentrate on throttle operation (1)
- · Press the control bar to glide
 - Return throttle when surfaced.
- At the same time, pull the control bar to

First jump flight

Piloting operation by (1)

Second jump flight

Piloting operation by (1) (Open throttle too much)

Floating

Close throttle

Timing delay due to reaching flotation speed earlier

Wind Pull the control ba Control Ba Engine Seat

Figure 1 Overview of the Control System

Floating to unintended height

Continued ascent and stall

The control bar was pressed and could not be

returned. (Stir/

Not yet mastered basic piloting operation)

Radio instructions to open throttle (Pilot not responding)

Crash from the nose

[Probable Causes: Improper Piloting]

It is probable that the pilot did not operate the control bar and throttle properly during the training of jump flight, resulting in the aircraft ascending to a height unintended by the pilot after floating, and then continuing to ascend and losing speed afterwards, causing the aircraft to crash from the nose.

[Factors: Lack of Knowledge, Skills, and Experience] Probable reasons why the piloting maneuver was not performed properly are as follows:

- · Operational training on the ground prior to the jump flight and flight training with a flight instructor on board were not sufficiently conducted.
- The pilot did not master the basic piloting operation.
